

ABSTRACT

Large volumes of electronic documents can be printed from a network, such as the Internet, using a batch printing technique. Sizable print jobs are broken into batches, which are sent sequentially to a printer executable component at the client side. As one batch finishes printing, another batch is sent to the printer executable component. Logs are kept so that if there is an interruption in the printing, a print job can be re-started at any batch, instead of having to re-start printing in its entirety from the beginning. The electronic documents may also be downloaded for storage alternatively or in addition to printing. Stamps may be applied en masse to the electronic documents to be printed.
